INFORMATION FOR AUTHORS

The Bulletin of the Australian Mathematical Society aims at quick publication of original research in all branches of mathematics. The Editors receive more than three times as much material as can be published in the BULLETIN; many meritorious papers can, therefore, not be accepted. Authors are asked to avoid, as far as possible the use of mathematical symbols in the title. Manuscripts are accepted for review with the understanding that the same work is not concurrently submitted elsewhere.

To ensure speedy publication, editorial decisions on acceptance or otherwise are taken quickly, normally within a month of receipt of the paper. Papers are accepted only after a careful evaluation by the Editor and an Associate Editor or other expert in the field. As even minor revisions are generally not permitted, authors should read carefully all the details listed below. For a paper to be acceptable for publication, not only should it contain new and interesting results but also

- (i) the exposition should be clear and attractive;
- (ii) the manuscript should be in publishable form, without revision.

Authors should submit three clean, high quality copies to

The Editorial Office, Bulletin of the Australian Mathematical Society,
Department of Mathematics, The University of Queensland,
Queensland 4072, Australia.

Unless requested at the time, material submitted to the BULLETIN will usually not be returned.

EDITORIAL POLICY

1. References. Arrange references alphabetically (by surname of the first author) and cite them numerically in the text. Ensure the accuracy of the references: authors' names should appear as in the work quoted. Include in the list of references only those works cited, and avoid citing works which are "in preparation" or "submitted". Where the work cited is not readily accessible (for example, a preprint) a photocopy of the title page and relevant sections of the copy that you have used should be included with your submission.

2. Abstracts.

1. Each paper must include an abstract of not more than 200 words, which should contain a brief but informative summary of the contents of the paper, but no inessential details.
2. The abstract should be self-contained, but may refer to the title.
3. Specific references (by number) to a section, proposition, equation or bibliographical item should be avoided.

3. Subject Classification. Authors should include in their papers one or more classification numbers, following the 2000 Mathematics Subject Classification. Details of this scheme can be found in each Annual Index of Mathematical Reviews or on the web at <http://www.ams.org/msc> .

4. Abstracts of Ph.D. Theses. The Bulletin endeavours to publish abstracts of all accepted Australasian Ph.D. theses in mathematics. One restriction, however, is that the abstract must be received by the Editor within 6 months of the degree being approved.

5. Electronic Manuscripts. The Bulletin is produced using $\mathcal{A}\mathcal{M}\mathcal{S}\text{-T}\mathcal{E}\mathcal{X}$. Authors who are able to do so are invited to prepare their manuscripts using $\text{T}\mathcal{E}\mathcal{X}$. (We accept Plain $\text{T}\mathcal{E}\mathcal{X}$, $\mathcal{A}\mathcal{M}\mathcal{S}\text{-T}\mathcal{E}\mathcal{X}$ or $\text{L}\mathcal{A}\text{T}\mathcal{E}\mathcal{X}$.) Hard copy only should be submitted for assessment, but if the paper is accepted the author will be asked to send the text on an IBM PC compatible diskette or via e-mail to ams@maths.uq.edu.au. [Typed manuscripts are, of course, still acceptable.]

EXISTENCE OF POSITIVE SOLUTIONS FOR NONLOCAL AND NONVARIATIONAL ELLIPTIC SYSTEMS

YUJUAN CHEN AND HONGJUN GAO

In the paper we prove a result on the existence of positive solutions for a class of nonvariational elliptic system with nonlocal source by Galerkin methods and a fixed point theorem in finite dimensions. We establish another existence result by the super and subsolution method and a monotone iteration.

1. INTRODUCTION AND MAIN RESULTS

In this paper, we consider the positive solutions for a class of elliptic system with nonlocal source:

$$(1.1) \quad \begin{cases} -\Delta u = f_1(x, u)\|v\|_{\alpha_1}^{p_1}, & x \in \Omega, \\ -\Delta v = f_2(x, v)\|u\|_{\alpha_2}^{p_2}, & x \in \Omega, \\ u > 0, v > 0, & x \in \Omega, \\ u = 0, v = 0, & x \in \partial\Omega. \end{cases}$$

where Ω is a bounded domain in R^N , $N \geq 1$, with smooth boundary $\partial\Omega$, $p_i > 0$, $1 \leq \alpha_i \leq \infty$ and f_i , $i = 1, 2$, satisfy some assumptions to be stated below.

This system can be used to describe the steady-state solutions of parabolic systems with a nonlocal source:

$$(1.2) \quad \begin{cases} u_t - \Delta u = f_1(x, u)\|v\|_{\alpha_1}^{p_1}, & x \in \Omega, t > 0, \\ v_t - \Delta v = f_2(x, v)\|u\|_{\alpha_2}^{p_2}, & x \in \Omega, t > 0, \\ u(x, t) = 0, v(x, t) = 0, & x \in \partial\Omega, t > 0, \\ u(x, 0) = u_0(x), v(x, 0) = v_0(x), & x \in \Omega. \end{cases}$$

When f_1, f_2 are positive constants, system (1.2) has been discussed by Deng, Li and Xie (see [4]). It was proved that if $p_1 p_2 < 1$ every nonnegative solution is global; whereas if $p_1 p_2 > 1$, and the initial data is sufficiently large, the nonnegative solution of (1.2) blows up in finite time, and if the initial data is sufficiently small, the nonnegative solution of (1.2) is global.

Over the last few decades, many physical phenomena were formulated into nonlocal mathematical models (see [2, 3, 4, 5, 6],7 or references therein). The corresponding steady-state solutions have been attached great importance. Compared to the existence of positive solutions for elliptic problems, different techniques (variational methods, degree theory, fixed point theory, sub and supersolutions, Galerkin methods, moving hyperplane methods, et cetera) have been used (see for instance [2, 3, 4, 5, 6],7). However, to the author's best knowledge, there is no literature on system (1.1). Since the system (1.1) has no variational structure, it is worthwhile to recall some of related nonvariational methods.

In [1], Alves and de Figureiredo used Galerkin methods and fixed point theorems in finite dimension and proved the existence of solutions of the local semilinear elliptic systems

$$\begin{aligned} -\Delta u &= au^\alpha + f(x, u, v), \\ -\Delta v &= bv^\beta + g(x, u, v), \end{aligned}$$

in a bounded domain with homogeneous boundary conditions.

In [3] Correa studied the problem

$$-a\left(\int_{\Omega} |u|^q\right)\Delta u = H(x)f(u)$$

with homogeneous boundary condition. To prove the existence of positive solutions, the Krasnoselskii fixed point theorem has been used in the unidimensional case and the Schaefer fixed point theorem in the multidimensional case.

In [2] Correa, Silbano Menezes and Ferreira used fixed point theorems and index theory to establish a positive solution for the problem

$$-a\left(\int_{\Omega} |u|\right)\Delta u = f(x, u).$$

Furthermore, they proved another existence result by using sub and supersolutions without monotone iteration, and relying heavily on a comparison principle and the Schaefer fixed point theorem.

The purpose of this paper is to study the existence of solutions of (1.1) in two cases via

- (a) Galerkin methods
- (b) super and subsolution techniques,

respectively. Our work is motivated by [1, 2, 3],6. From the viewpoint of physics, we are considering the positive weak solutions. We shall use the following definition of the weak solution for (1.1).

DEFINITION 1.1: We say a function $(u, v) \in H_0^1(\Omega) \times H_0^1(\Omega)$ is a weak solution of (1.1) provided

$$\begin{aligned} \int_{\Omega} \nabla u \nabla w \, dx &= \|v\|_{\alpha_1}^{p_1} \int_{\Omega} f_1(x, u) w \, dx, \\ \int_{\Omega} \nabla v \nabla w \, dx &= \|u\|_{\alpha_2}^{p_2} \int_{\Omega} f_2(x, v) w \, dx, \end{aligned}$$

for all $w \in H_0^1(\Omega)$.

This paper is organised as follows. In the next section, we use Galerkin methods to establish an existence theorem for the solution for system (1.1) when $N \geq 3$, $0 < p_i < 1$, $1 < \alpha_i < (2N)/(N-1)$ or $N = 1, 2$, $0 < p_i < 1$, $1 \leq \alpha_i < \infty$, $i = 1, 2$. In Section 3, we established another existence result for (1.1) by making use of super and subsolution techniques and where the monotone iteration is used. When f_i ($i = 1, 2$) is bounded and $p_1 p_2 < 1$, we get a pair of super and subsolution of (1.1) Finally we consider the special case $\alpha_i = p_i = 1$, $i = 1, 2$ and show the only probable solution is the trivial one under some assumptions on f_1, f_2 .

Our main results read as follows.

Theorem 1.2. *If either the following (H1) or (H2) is satisfied, system (1.1) has a positive solution.*

$$(H1) \quad N \geq 3, \quad 0 < p_i < 1, \quad 1 < \alpha_i < (2N)/(N-2),$$

$$0 \leq D_1(x) \leq f_1(x, u) \leq A_1(x)|u|^{r_1} + B_1(x),$$

$$0 \leq D_2(x) \leq f_2(x, v) \leq A_2(x)|v|^{r_2} + B_2(x),$$

$$B_i(x) \in L^{(\alpha_j)/(\alpha_j-1)}, \quad A_i(x) \in L^{(\alpha_j)/(\alpha_j-r_i-1)},$$

$r_i < \min\{1 - p_i, \alpha_j - 1\}$, $D_i(x) \not\equiv 0$ ($i = 1, 2$), where $ij = 2$ and i, j are positive integers.

$$(H2) \quad N = 1, 2, \text{ for } i = 1, 2, \quad 0 < p_i < 1, \quad 1 \leq \alpha_i < \infty.$$

Theorem 1.3. *Suppose that $f_1(\cdot, u) \in C(\overline{\Omega} \times R)$, $f_2(\cdot, v) \in C(\overline{\Omega} \times R)$ are nondecreasing and Lipschitz continuous in u and v respectively. Assume there exists a weak supersolution $(\bar{u}(x), \bar{v}(x))$ and a weak subsolution $(\underline{u}(x), \underline{v}(x))$ of system (1.1), satisfying*

$$(1.3) \quad \begin{aligned} (\bar{u}(x), \bar{v}(x)) &\geq 0, \quad (\underline{u}(x), \underline{v}(x)) \leq 0 \text{ on } \partial\Omega \text{ in the trace sense,} \\ (\underline{u}(x), \underline{v}(x)) &\leq (\bar{u}(x), \bar{v}(x)) \text{ almost everywhere in } \Omega. \end{aligned}$$

Then there exists a solution (u, v) of (1.1), such that

$$(1.4) \quad (\underline{u}(x), \underline{v}(x)) \leq (u(x), v(x)) \leq (\bar{u}(x), \bar{v}(x)) \text{ almost everywhere in } \Omega.$$

Furthermore, if $(\underline{u}(x), \underline{v}(x)) > 0$ in Ω , the solution of system (1.1) is positive.

Theorem 1.4. *In addition to the assumptions on f_1, f_2 of Theorem 1.3, we assume further that $0 < m_1 \leq f_1(x, u) \leq M_1$, $0 < m_2 \leq f_2(x, v) \leq M_2$ in $\Omega \times R$, $p_1 p_2 < 1$, then there exists a positive solution of system (1.1).*

2. GALERKIN METHODS

In this section we show the existence of solutions for the system (1.1) via Galerkin methods. The following Fixed Point Theorem is used (see [1] or [6, Chapter 9]).

Proposition 2.1. *Let $F : R^K \rightarrow R^K$ ($K \in \mathbb{N}$) be a continuous function such that $\langle F(\xi), \xi \rangle \geq 0$ on $|\xi| = r$. Then, there exists $z_0 \in \bar{B}_r(0)$ such that $F(z_0) = 0$. Here $\langle \cdot, \cdot \rangle$ denotes inner product of two vectors.*

PROOF OF THEOREM 1.2: First, we shall study the existence for the solution of the following systems

$$(2.1) \quad \begin{aligned} -\Delta u &= f_1(x, u) \|v\|_{\alpha_1}^{p_1} + \lambda \phi, & x \in \Omega, \\ -\Delta v &= f_2(x, v) \|u\|_{\alpha_2}^{p_2} + \lambda \phi, & x \in \Omega, \\ u > 0, v > 0, & & x \in \Omega \\ u = 0, v = 0, & & x \in \partial\Omega. \end{aligned}$$

where $\phi \in C_0^\infty(\Omega)$ is a fixed positive function and λ is a positive parameter.

Let $\sum = \{e_1, \dots, e_n, \dots\}$ be an orthogonal basis of the Hilbert space $H_0^1(\Omega)$ and be smooth. For each $m \in N$ define the subspace $V_m = \text{span}\{e_1, \dots, e_m\}$. It is well known that $(V_m, \|\cdot\|)$ and $(R^m, |\cdot|)$ are isometrically isomorphic by the natural linear map $T : V_m \rightarrow R^m$ given by

$$v = \sum_{i=1}^m \xi_i e_i \mapsto T(v) = \xi = (\xi_1, \xi_2, \dots, \xi_m).$$

So $\|v\| = |T(v)| = |\xi|$, where $|\cdot|$ and $\|\cdot\|$ denote the usual norms in R^m and $V_m(\Omega)$, respectively.

Consider the following function $F : R^{2m} \rightarrow R^{2m}$ given by

$$F(\xi, \eta) = (F_1(\xi, \eta), \dots, F_m(\xi, \eta), G_1(\xi, \eta), \dots, G_m(\xi, \eta)),$$

where

$$F_i(\xi, \eta) = \int_{\Omega} \nabla u \nabla e_i \, dx - \|v\|_{\alpha_1}^{p_1} \int_{\Omega} f_1(x, u) e_i \, dx - \lambda \int_{\Omega} \phi e_i \, dx,$$

and

$$G_i(\xi, \eta) = \int_{\Omega} \nabla v \nabla e_i \, dx - \|u\|_{\alpha_2}^{p_2} \int_{\Omega} f_2(x, v) e_i \, dx - \lambda \int_{\Omega} \phi e_i \, dx, \quad i = 1, 2, \dots, m.$$

In the above definitions we are using the identifications

$$\xi \mapsto u = \sum_{i=1}^m \xi_i e_i \quad \text{and} \quad \eta \mapsto v = \sum_{i=1}^m \eta_i e_i.$$

Note that

$$\begin{aligned} \langle F(\xi, \eta), (\xi, \eta) \rangle &= \|u\|^2 - \|v\|_{\alpha_1}^{p_1} \int_{\Omega} f_1(x, u) u \, dx \\ &\quad - \lambda \int_{\Omega} \phi u \, dx + \|v\|^2 - \|u\|_{\alpha_2}^{p_2} \int_{\Omega} f_2(x, v) v \, dx - \lambda \int_{\Omega} \phi v \, dx, \end{aligned}$$

and when $N \geq 3$, we have $H_0^1(\Omega) \subset L^q(\Omega)$, where $1 < q < (2N)/(N-2)$. By (H1) and the Hölder inequality, we have

$$\begin{aligned} &\|v\|_{\alpha_1}^{p_1} \int_{\Omega} f_1(x, u) u \, dx + \|u\|_{\alpha_2}^{p_2} \int_{\Omega} f_2(x, v) v \, dx \\ &\leq \|v\|_{\alpha_1}^{p_1} \int_{\Omega} (A_1(x)|u|^{r_1} + B_1(x)) u \, dx + \|u\|_{\alpha_2}^{p_2} \int_{\Omega} (A_2(x)|v|^{r_2} + B_2(x)) v \, dx \\ &\leq \|v\|_{\alpha_1}^{p_1} \left[\|A_1(x)\|_{\alpha_2/(\alpha_2-r_1-1)} \|u\|_{\alpha_2}^{r_1+1} + \|B_1(x)\|_{\alpha_2/(\alpha_2-1)} \|u\|_{\alpha_2} \right] \\ &\quad + \|u\|_{\alpha_2}^{p_2} \left[\|A_2(x)\|_{\alpha_1/(\alpha_1-r_2-1)} \|v\|_{\alpha_1}^{r_2+1} + \|B_2(x)\|_{\alpha_1/(\alpha_1-1)} \|v\|_{\alpha_1} \right] \\ &\leq C (\|u\|^{p_1+r_1+1} + \|v\|^{p_1+r_1+1} + \|u\|^{p_2+r_2+1} + \|v\|^{p_2+r_2+1} \\ &\quad + \|u\|^{p_1+1} + \|v\|^{p_1+1} + \|u\|^{p_2+1} + \|v\|^{p_2+1}). \end{aligned}$$

Here and elsewhere, we may use the same letter C to indicate (possibly different) positive constants. With $\|(u, v)\|^2 = \|u\|^2 + \|v\|^2$, we obtain

$$\begin{aligned} \langle F(\xi, \eta), (\xi, \eta) \rangle &\geq \|(u, v)\|^2 - C \left[\|(u, v)\|^{p_1+r_1+1} \right. \\ &\quad \left. + \|(u, v)\|^{p_2+r_2+1} + \|(u, v)\|^{p_1+1} + \|(u, v)\|^{p_2+1} \right] - \lambda C \|(u, v)\|. \end{aligned}$$

As of $0 < p_i + r_i < 1$ and $0 < p_i < 1$, there exists a sufficient large ρ such that

$$\langle F(\xi, \eta), (\xi, \eta) \rangle > 0 \quad \text{on} \quad \|(u, v)\| = \rho \quad (\rho \text{ is independent of } m).$$

It follows from Proposition 2.1 that, for each $m \in N$ there exists $(u_m, v_m) \in V_m \times V_m$ satisfying

$$(2.2) \quad F(u_m, v_m) = (0, 0), \quad \|(u_m, v_m)\| \leq \rho.$$

Then (2.2) implies

$$\begin{aligned}\int_{\Omega} \nabla u_m \nabla w \, dx &= \|v_m\|_{\alpha_1}^{p_1} \int_{\Omega} f_1(x, u_m) w \, dx + \lambda \int_{\Omega} \phi w \, dx, \quad \forall w \in V_m, \\ \int_{\Omega} \nabla v_m \nabla w \, dx &= \|u_m\|_{\alpha_2}^{p_2} \int_{\Omega} f_2(x, v_m) w \, dx + \lambda \int_{\Omega} \phi w \, dx, \quad \forall w \in V_m,\end{aligned}$$

with $\|u_m\|, \|v_m\| \leq \rho$, $\forall m \in N$. Let $u, v \in H_0^1(\Omega)$ be the weak limit of $\{u_m\}$ and $\{v_m\}$ respectively, choosing subsequences if necessary. So

$$\begin{aligned}(u_m, v_m) &\rightharpoonup (u, v) \text{ weakly in } H_0^1(\Omega), \\ (u_m, v_m) &\rightarrow (u, v) \text{ in } L^q(\Omega) \text{ for } 1 < q < \frac{2N}{N-2}, \text{ (since } H_0^1 \text{ is compact in } L^q(\Omega)) \\ (u_m, v_m) &\rightarrow (u, v) \text{ almost everywhere in } \Omega.\end{aligned}$$

Considering $w \in V_k$, $\Psi \in V_k$ and $m \geq k$ we have

$$(2.3) \quad \begin{aligned}\int_{\Omega} \nabla u_m \nabla w \, dx &= \|v_m\|_{\alpha_1}^{p_1} \int_{\Omega} f_1(x, u_m) w \, dx + \lambda \int_{\Omega} \phi w \, dx, \quad \forall w \in V_k, \\ \int_{\Omega} \nabla v_m \nabla \Psi \, dx &= \|u_m\|_{\alpha_2}^{p_2} \int_{\Omega} f_2(x, v_m) \Psi \, dx + \lambda \int_{\Omega} \phi \Psi \, dx, \quad \forall \Psi \in V_k,\end{aligned}$$

Then taking the limits as $m \rightarrow \infty$, we obtain

$$(2.4) \quad \begin{aligned}\int_{\Omega} \nabla u \nabla w \, dx &= \|v\|_{\alpha_1}^{p_1} \int_{\Omega} f_1(x, u) w \, dx + \lambda \int_{\Omega} \phi w \, dx, \quad \forall w \in V_k, \\ \int_{\Omega} \nabla v \nabla \Psi \, dx &= \|u\|_{\alpha_2}^{p_2} \int_{\Omega} f_2(x, v) \Psi \, dx + \lambda \int_{\Omega} \phi \Psi \, dx, \quad \forall \Psi \in V_k,\end{aligned}$$

The equality (2.4) holds for all functions in H_0^1 , as functions of the form w and Ψ are dense in this space. Hence (u, v) is a weak solution of the system (2.1).

Recalling that $\lambda > 0, \phi > 0$, it follows from the maximum principle that $u, v > 0$ in Ω . Then according to (H1), we have

$$\begin{aligned}-\Delta(u/\|v\|_{\alpha_1}^{p_1}) &\geq D_1(x), \\ -\Delta(v/\|u\|_{\alpha_2}^{p_2}) &\geq D_2(x).\end{aligned}$$

Let (z_1, z_2) be the only positive solution of

$$\begin{aligned}-\Delta z_1 &= D_1(x), \quad \text{in } \Omega, \\ -\Delta z_2 &= D_2(x), \quad \text{in } \Omega, \\ z_1 &= z_2 = 0, \quad \text{on } \partial\Omega.\end{aligned}$$

According to the maximum principle, we have $u/\|v\|_{\alpha_1}^{p_1} \geq z_1, v/\|u\|_{\alpha_2}^{p_2} \geq z_2$ in Ω , which implies

$$\begin{aligned}\|u\|_{\alpha_2} &\geq (\|z_1\|_{\alpha_2} \|z_2\|_{\alpha_1}^{p_1})^{1/(1-p_1p_2)} > 0, \\ \|v\|_{\alpha_1} &\geq (\|z_1\|_{\alpha_2}^{p_2} \|z_2\|_{\alpha_1})^{1/(1-p_1p_2)} > 0,\end{aligned}$$

So $\|u\|_{\alpha_2}, \|v\|_{\alpha_1}$ has a positive lower bound. Moreover, take $\lambda = 1/n, n = 1, 2, \dots$ and denote the corresponding solution of (2.1) as (u_n, v_n) , that is (u_n, v_n) satisfies (2.4) with any w and Ψ in $H_0^1(\Omega)$. Set $w = u_n, \Psi = v_n$ in (2.4), we get

$$\begin{aligned}\|(u_n, v_n)\|^2 &\leq C \left(\|(u_n, v_n)\|^{p_1+r_1+1} + \|(u_n, v_n)\|^{p_2+r_2+1} + \|(u_n, v_n)\|^{p_1+1} \right. \\ &\quad \left. + \|(u_n, v_n)\|^{p_2+1} + \|(u_n, v_n)\| \cdot \|\phi\|_2 \right) \text{ for all } n \in \mathbb{N}.\end{aligned}$$

Since $0 < p_i + r_i < 1$, and $0 < p_i < 1$, $\{(u_n, v_n)\}$ is a bounded sequence. As $n \rightarrow \infty$, thanks to the Sobolev embedding and the Lebesgue convergence theorem, a positive solution of (1.1) is obtained.

The case (H2) can be proved similarly, since for $N = 1$,

$$H_0^1(\Omega) \subset C^\alpha(\bar{\Omega}), \quad 0 < \alpha \leq 1/2,$$

and for $N = 2$,

$$H_0^1(\Omega) \subset L^q(\Omega), \quad 1 \leq q < \infty.$$

So its proof is omitted. □

3. SUPER AND SUBSOLUTION METHOD

Over the past two decades, supersolution and subsolution methods have been widely used in the proof of the existence of the solutions of parabolic or elliptic problems. In this section, we shall use this technique to prove the existence of the solution of system (1.1).

First, we shall give the definition of the super and subsolution of system (1.1).

DEFINITION 3.1: A function $(\bar{u}, \bar{v}) \in H_0^1(\Omega) \times H_0^1(\Omega)$ is called a weak supersolution of (1.1) if

$$\int_{\Omega} \nabla \bar{u} \nabla w \, dx \geq \|\bar{v}\|_{\alpha_1}^{p_1} \int_{\Omega} f_1(x, \bar{u}) w \, dx, \text{ for each } w \in H_0^1, w > 0 \text{ almost everywhere,} \quad (3.1)$$

$$\int_{\Omega} \nabla \bar{v} \nabla \Psi \, dx \geq \|\bar{u}\|_{\alpha_2}^{p_2} \int_{\Omega} f_2(x, \bar{v}) \Psi \, dx, \text{ for each } \Psi \in H_0^1, \Psi > 0 \text{ almost everywhere.}$$

Similarly, $(\underline{u}(x), \underline{v}(x)) \in H_0^1(\Omega)$ is called a weak subsolution if it satisfies (3.1) with reversed inequalities.

PROOF OF THEOREM 1.3: The method is standard, but for the reader's convenience, we complete it. Now write $(u_0, v_0) = (\underline{u}, \underline{v})$, we can construct a sequence $\{(u_k, v_k)\} \in H_0^1(\Omega) \times H_0^1(\Omega)$ from the following iterative process

$$(3.2) \quad \begin{aligned} \int_{\Omega} \nabla u_k \nabla w \, dx &= \|v_{k-1}\|_{\alpha_1}^{p_1} \int_{\Omega} f_1(x, u_{k-1}) w \, dx, \\ \int_{\Omega} \nabla v_k \nabla \Psi \, dx &= \|u_{k-1}\|_{\alpha_2}^{p_2} \int_{\Omega} f_2(x, v_{k-1}) \Psi \, dx. \end{aligned}$$

We claim

$$(3.3) \quad (\underline{u}, \underline{v}) \leq (u_1, v_1) \leq \cdots \leq (u_n, v_n) \leq \cdots \leq (\bar{u}, \bar{v}).$$

To confirm this, first note from (3.2) for $k = 1$ that

$$(3.4) \quad \begin{aligned} \int_{\Omega} \nabla u_1 \nabla w \, dx &= \|v_0\|_{\alpha_1}^{p_1} \int_{\Omega} f_1(x, u_0) w \, dx, \\ \int_{\Omega} \nabla v_1 \nabla \Psi \, dx &= \|u_0\|_{\alpha_2}^{p_2} \int_{\Omega} f_2(x, v_0) \Psi \, dx \end{aligned}$$

for each $w, \Psi \in H_0^1(\Omega)$. Subtract (3.4) from (3.1), recall $(u_0, v_0) = (\underline{u}, \underline{v})$ and set $w = (u_0 - u_1)^+$, $\Psi = (v_0 - v_1)^+$, to get

$$(3.5) \quad \begin{aligned} \int_{\Omega} \nabla(u_0 - u_1) \cdot \nabla(u_0 - u_1)^+ \, dx &\leq 0, \\ \int_{\Omega} \nabla(v_0 - v_1) \cdot \nabla(v_0 - v_1)^+ \, dx &\leq 0. \end{aligned}$$

But

$$\begin{aligned} \nabla(u_0 - u_1)^+ &= \begin{cases} \nabla(u_0 - u_1), & \text{almost everywhere on } \{u_0 \geq u_1\}, \\ 0 & \text{almost everywhere on } \{u_0 \leq u_1\}, \end{cases} \\ \nabla(v_0 - v_1)^+ &= \begin{cases} \nabla(v_0 - v_1), & \text{almost everywhere on } \{v_0 \geq v_1\}, \\ 0 & \text{almost everywhere on } \{v_0 \leq v_1\}, \end{cases} \end{aligned}$$

(see [6, Chapter 5]). Consequently,

$$(3.6) \quad \begin{aligned} \int_{\{u_0 \geq u_1\}} |\nabla(u_0 - u_1)|^2 \, dx &\leq 0, \\ \int_{\{v_0 \geq v_1\}} |\nabla(v_0 - v_1)|^2 \, dx &\leq 0, \end{aligned}$$

so that $(u_0, v_0) \leq (u_1, v_1)$ almost everywhere in Ω . Now assume inductively

$$(3.7) \quad (u_{k-1}, v_{k-1}) \leq (u_k, v_k) \text{ almost everywhere in } \Omega$$

From (3.2) we find similarly

$$\begin{aligned} & \int_{\{u_k \geq u_{k+1}\}} \nabla(u_k - u_{k+1}) \cdot \nabla(u_k - u_{k+1})^+ dx \\ & \leq \int_{\Omega} (f_1(x, u_{k-1}) \|v_{k-1}\|_{\alpha_1}^{p_1} - f_1(x, u_k) \|v_k\|_{\alpha_1}^{p_1}) (u_k - u_{k+1})^+ dx \leq 0, \\ & \int_{\{v_k \geq v_{k+1}\}} \nabla(v_k - v_{k+1}) \cdot \nabla(v_k - v_{k+1})^+ dx \\ & \leq \int_{\Omega} (f_2(x, v_{k-1}) \|u_{k-1}\|_{\alpha_2}^{p_2} - f_2(x, v_k) \|u_k\|_{\alpha_2}^{p_2}) (v_k - v_{k+1})^+ dx \leq 0. \end{aligned}$$

The last inequality holds in view of (3.7) and $f_1(\cdot, u), f_2(\cdot, v)$ is nondecreasing in u and v respectively. Therefore $(u_k, v_k) \leq (u_{k+1}, v_{k+1})$ almost everywhere in Ω .

$$\begin{aligned} & \int_{\{u_{k+1} \geq \bar{u}\}} |\nabla(u_{k+1} - \bar{u})|^2 dx \leq \int_{\{u_{k+1} \geq \bar{u}\}} (f_1(x, u_k) \|v_k\|_{\alpha_1}^{p_1} \\ & \quad - f_1(x, \bar{u}) \|\bar{v}\|_{\alpha_1}^{p_1}) (u_{k+1} - \bar{u})^+ dx \leq 0, \\ & \int_{\{v_{k+1} \geq \bar{v}\}} |\nabla(v_{k+1} - \bar{v})|^2 dx \leq \int_{\{v_{k+1} \geq \bar{v}\}} (f_2(x, v_k) \|u_k\|_{\alpha_2}^{p_2} \\ & \quad - f_2(x, \bar{v}) \|\bar{u}\|_{\alpha_2}^{p_2}) (v_{k+1} - \bar{v})^+ dx \leq 0. \end{aligned}$$

Next we show that $(u_k, v_k) \leq (\bar{u}, \bar{v})$ almost everywhere in Ω . It is valid for $k = 0$ by hypothesis (1.3). Assume now for induction $(u_k, v_k) \leq (\bar{u}, \bar{v})$ almost everywhere in Ω . Then we have

Thus $(u_{k+1}, v_{k+1}) \leq (\bar{u}, \bar{v})$ almost everywhere in Ω .

Therefore $(u(x), v(x)) := \lim_{n \rightarrow \infty} (u_n(x), v_n(x))$ exists for almost all x . Furthermore, by the assumptions on $f_i (i = 1, 2)$, there is a subsequence $\{(u_{n_j}, v_{n_j})\}_{j=1}^{\infty}$ which converges weakly in $H_0^1(\Omega) \times H_0^1(\Omega)$ to (u, v) . So, (u, v) is a weak solution of (1.1). The theorem follows. \square

Theorem 1.4 is an example in which the above result applies.

PROOF OF THEOREM 1.4: Let (w_1, w_2) be the only solution of

$$(3.8) \quad \begin{aligned} & -\Delta w_1 = m_1, \quad \text{in } \Omega, \\ & -\Delta w_2 = m_2, \quad \text{in } \Omega, \\ & w_1 = w_2 = 0, \quad \text{on } \partial\Omega. \end{aligned}$$

Set

$$\underline{u} = (\|w_1\|_{\alpha_1}^{p_1 p_2} \|w_2\|_{\alpha_2}^{p_2})^{1/(1-p_1 p_2)} w_1, \quad \underline{v} = (\|w_2\|_{\alpha_1}^{p_1 p_2} \|w_1\|_{\alpha_2}^{p_2})^{1/(1-p_1 p_2)} w_2,$$

then $(\underline{u}, \underline{v})$ is a positive subsolution of system (1.1). Similarly, if we denote by (W_1, W_2) the only positive solution of (3.8) with m_1, m_2 be replaced by M_1, M_2 respectively, we can get the supersolution (\bar{u}, \bar{v}) of system (1.1), where

$$\bar{u} = (\|W_1\|_{\alpha_1}^{p_1 p_2} \|W_2\|_{\alpha_2}^{p_2})^{1/(1-p_1 p_2)} W_1, \quad \bar{v} = (\|W_2\|_{\alpha_1}^{p_1 p_2} \|W_1\|_{\alpha_2}^{p_2})^{1/(1-p_1 p_2)} W_2$$

As $m_i \leq M_i$, we have $w_i \leq W_i, i = 1, 2$. In addition, $0 < p_1 p_2 < 1$, so $(\underline{u}, \underline{v}) \leq (\bar{u}, \bar{v})$. Theorem 1.3 completes the proof. \square

Now, for the the special case $\alpha_i = p_i = 1$, becomes the system

$$(3.9a) \quad -\Delta u = f_1(x, u) \int_{\Omega} |v| dx, \quad x \in \Omega,$$

$$(3.9b) \quad -\Delta v = f_2(x, v) \int_{\Omega} |u| dx, \quad x \in \Omega,$$

$$(3.9c) \quad u = v = 0, \quad x \in \partial\Omega.$$

Denote by $\varphi_0(x)$ the unique positive solution of the linear elliptic problem

$$-\Delta\varphi_0(x) = 1, \quad x \in \Omega; \quad \varphi_0(x) = 0, \quad x \in \partial\Omega.$$

Set $\rho = \int_{\Omega} \varphi_0(x) dx$. Thus, we have the following result.

PROPOSITION 3.2. *In addition to the assumptions on f_1, f_2 of Theorem 1.3, assume further $0 < f_i \leq M_i (i = 1, 2)$ in $\Omega \times R$. Then nonnegative solutions of (3.9) exist if $\rho^2 \leq 1/(M_1 M_2)$.*

PROOF: Applying $\rho^2 \leq 1/(M_1 M_2)$, we see that there exist large positive constants K_1 and K_2 such that

$$M_1 \rho \leq K_1 / K_2 \leq 1 / (M_2 \rho).$$

Let $W(x) = K_1 \varphi_0(x)$, $S(x) = K_2 \varphi_0(x)$, then (W, S) is a pair of supersolutions of (3.9). Furthermore, $(0, 0)$ is its subsolution, so we can get a nonnegative solution via Theorem 1.3. \square

Indeed, we have the following result.

PROPOSITION 3.3. *Assume $0 < m_i < f_i \leq M_i (i = 1, 2)$ in $\Omega \times R$, and ρ satisfies*

$$(3.10) \quad \rho^2 < \frac{1}{M_1 M_2} \quad \text{or} \quad \rho^2 > \frac{1}{m_1 m_2}.$$

Then the system (3.9) only possesses the trivial solution.

PROOF: Suppose (u, v) is a non trivial solution of (3.9). Multiplying (3.9a), (3.9b) through by φ_0 and integrating on Ω respectively, we find

$$\begin{aligned}\int_{\Omega} u \, dx &= \|v\|_1 \int_{\Omega} f_1(x, u) \varphi_0 \, dx \\ \int_{\Omega} v \, dx &= \|u\|_1 \int_{\Omega} f_2(x, v) \varphi_0 \, dx.\end{aligned}$$

Since $0 < m_i \leq f_i \leq M_i (i = 1, 2)$, and φ_0 is a positive function, we have

$$\begin{aligned}m_1 \rho \|v\|_1 &\leq \|u\|_1 \leq M_1 \rho \|v\|_1, \\ m_2 \rho \|u\|_1 &\leq \|v\|_1 \leq M_2 \rho \|u\|_1.\end{aligned}$$

So

$$m_1 m_2 \rho^2 \|u\|_1 \|v\|_1 \leq \|u\|_1 \|v\|_1 \leq M_1 M_2 \rho^2 \|u\|_1 \|v\|_1.$$

The conclusion follows since (3.10) holds. □
